

Ref Talks

2024

Spring Series

Paediatric Surgery

Overview

The session will cover some of the more common general surgery of childhood conditions that might be seen in primary care. Topics such as inguinal and scrotal pathology, penile abnormalities, midline abdominal wall hernias, labial anatomy and variations will be included. The talk will highlight the revision of the relevant embryology and anatomy to help inform discussions with families and know when to seek a more specialist opinion. Additional information about the more common day-case surgical procedures done will be shared too.
